EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Michael Monaco (#52041) on 11/18/2009.

The application has been amended as follows:

In the claims:

Claim 3 is canceled

1. (Currently Amended) A selective device recognition apparatus in a UPnP based home network, the apparatus comprising:

a network stream processing unit configured to parse a device characteristic data of a device and to read a network transmission possible identifier and a device characteristic identifier, the device being automatically detectable in the UPnP based home network, wherein the network transmission possible identifier is set to recognize a device according to a user's authority; and

a network transmission judging unit configured to compare the read network transmission possible identifier with a preset network transmission possible identifier recorded in a transmission judgment table, and to judge whether to perform network transmission of the device characteristic data according to a result of the comparison,

wherein the network transmission judging unit is configured to transmit a disable signal for intercepting a transmission of the device characteristic data only when the network transmission possible identifier read from the network stream processing unit and the preset network transmission possible identifier are different, and to transmit the device characteristic data only when the network transmission possible identifier read from the network stream processing unit is matched with the preset network transmission possible identifier,

wherein the network stream processing unit includes:

a preprocessor configured to parse the device characteristic data;

a buffer manager configured to temporally store the device characteristic data parsed in the preprocessor in a buffer and to output a registry signal corresponded thereto; and
an identifier reader configured to search the device characteristic data temporally stored in the buffer according to the registry signal outputted from the buffer manager and read the device characteristic identifier and the network transmission possible identifier.

4. (Currently Amended) The apparatus of ~~claim 3~~ claim 1, wherein the preprocessor performs parsing of the device characteristic data by device characteristic data units divided by a token(/).

6. (Currently Amended) A selective device recognition method in a UPnP based home network, the method comprising:

receiving and parsing a device characteristic data of a device, the device being automatically detectable in the UPnP based home network;

temporally storing the parsed device characteristic data and outputting a registry signal corresponded thereto;

searching the temporally stored parsed device characteristic data according to the outputted registry signal;

reading a device characteristic identifier and a network transmission possible identifier from the searched parsed device characteristic data, wherein the network

transmission possible identifier is set to recognize a device according to a user's authority;

comparing the read network transmission possible identifier with a preset network transmission possible identifier recorded in a transmission judgment table, and judging whether to perform network transmission of the device characteristic data corresponded to the read device characteristic identifier is performed according to a result of the comparison; and

transmitting a disable signal for intercepting a transmission of the device characteristic data only when the read network transmission possible identifier and the preset network transmission possible identifier are different, and transmitting the device characteristic data only when the read network transmission possible identifier is matched with the preset network transmission possible identifier.

17. (Currently Amended) A selective device recognition apparatus in a UPnP based home network, the apparatus comprising:

a network stream processing unit configured to parse a device characteristic data of a device and to read a network transmission possible identifier and a device characteristic identifier, wherein the network transmission possible identifier is set to recognize a device according to a user's authority; and

a network transmission judging unit configured to compare the read network transmission possible identifier with a preset network transmission possible identifier

recorded in a transmission judgment table, and to judge whether to perform network transmission of the device characteristic data according to a result of the comparison,

wherein the device characteristic data is transmitted by only a home network device recognizing the network transmission possible identifier,

wherein the network transmission judging unit is configured to transmit a disable signal for intercepting a transmission of the device characteristic data only when the network transmission possible identifier read from the network stream processing unit and the preset network transmission possible identifier are different, and to transmit the device characteristic data only when the network transmission possible identifier read from the network stream processing unit is matched with the preset network transmission possible identifier,

wherein the network stream processing unit includes:

a preprocessor configured to parse the device characteristic data;

a buffer manager configured to temporally store the device characteristic data parsed in the preprocessor in a buffer and to output a registry signal corresponded thereto; and

an identifier reader configured to search the device characteristic data temporally stored in the buffer according to the registry signal outputted from the buffer manager and read the device characteristic identifier and the network transmission possible identifier.
